About the cover: Immunohistological localization of PIP₂ and radixin in the small intestinal tissue of mice was evaluated by single or double immunofluorescence staining. Using specific antibodies for the detection of (A) PIP₂ or (B) radixin, significant amounts of signals were detected for both proteins in the small intestinal tissues including the villous surface region and stromal regions located at sub-epithelium. Furthermore, these fluorescence signals were highly co-localized in both regions (C). (A) magenta; PIP₂, (B) green; radixin or (C) merged picture, respectively. Scale bar; 25 μm. See the article by Kobori *et al.* on page 1124 of this issue.
