ON THE COVER: Bio-inspired crystal synthesis in combination with high-resolution synchrotron powder diffraction was used to demonstrate that a recombinant GFP-tagged biominerization protein is incorporated into the crystal lattice of calcite to an extent comparable to the natural system. In contrast, pure GFP is hardly incorporated at all. This approach opens a promising route toward the synthesis of new and improved biocomposite materials. For more information, see “Incorporation of a Recombinant Biominerization Fusion Protein into the Crystalline Lattice of Calcite” by Eva Weber, Leonid Bloch, Christina Guth, Andy N. Fitch, Ingrid M. Weiss, and Boaz Pokroy* (*Chem. Mater.* 2014, 26, 4925–4932).
