Ultrasound Image Resolution Improvement Through PSF Effect Elimination

The conventional ultrasound images suffer from low resolution due to the convolution effect of the point spread function (PSF) on the backscattered radio frequency (RF) data. The l_1 -bMCLMS algorithm can remove the convolution effect of the PSF and estimate the tissue reflectivity function (TRF) from the measured RF data, and thereby improve resolution of the clinical ultrasound images. The improved performance of l_1 -bMCLMS algorithm in terms of resolution gain and normalized misalignment parameter of the TRF may find promising applications in clinical ultrasound imaging. The cover figure shows a) the convergence of the l_1 -bMCLMS cost function, b) the estimated PSF by the l_1 -bMCLMS algorithm, spectrum of the c) estimated TRF, d) estimated PSF, and e) estimated RF superimposed with the original RF, and at last demonstrates the resolution improvement presenting the f) conventional and g) deconvolved l_1 -bMCLMS images with their h-i) zoomed-in views.
