Cover photograph (Copyright © 2013, American Society for Microbiology.): Carcinoembryonic antigen-related cell adhesion molecule 3 (CEACAM3)-mediated phagocytosis of *Neisseria gonorrhoeae* by human neutrophil granulocytes. Primary granulocytes (light blue) isolated from peripheral blood were infected with *N. gonorrhoeae* for 30 min. The bacteria (yellow) express an outer membrane protein that is recognized by the granulocyte receptor CEACAM3. The pseudocolored scanning electron microscopy image highlights the large lamellipodial protrusions induced by CEACAM3 engagement, which finally result in the efficient, opsonin-independent phagocytosis of multiple gonococci.
