AIM2 and IFI16 are intracellular, inflammasome-activating sensors of DNA that are pivotal for the detection of viral infections. Stehlik and colleagues (p 343; and News and Views by Eisenbarth, p 311) found a previously unrecognized protein, POP3, that functions as an inhibitor of DNA-induced inflammasomes. The original image, generated by Sonal Khare and Christian Stehlik, shows a macrophage transduced with a green fluorescent protein-expressing adenovirus (green) and DNA (blue) and stained for AIM2 (magenta).
