**COVER IMAGE**

Rogue waves in a sea of photons can localize light beyond the diffraction limit, but their rarity makes them difficult to study. These events can now be controllably triggered in a photonic crystal resonator.

Article p358

A theoretical and experimental study reveals the relationship between charge density waves and orbital textures for different stackings in a two-dimensional layered material.

Letter p328

Topologically protected states with a natural helicity are shown to form at step edges, which can be created with subnanometre precision using atomic force microscopy, in a weak topological insulator.
