Volume 26 Number 9 September 2014

The electronic form of this issue, available at www.plantcell.org, is the journal of record.

ON THE COVER

Photosynthetic light harvesting in plants is regulated by phosphorylation-driven state transitions, involving the functional redistribution of the major light-harvesting complex II (LHCII) to balance the relative excitation of PSI and PSII. Pietrzykowska et al. (pages 3646–3660) show that despite their nearly identical amino acid composition, the functional roles of Lhcb1 and Lhcb2 are different but complementary. Results show that both Lhcb1 and Lhcb2 are required for state transitions, but neither alone is sufficient. Lhcb1 was found to be important for grana stacking and membrane reorganization during state transitions, while Lhcb2 has more of a role in mediating the association of LHCII to PSI. The cover image shows electron micrographs of *Arabidopsis* wild type (top) and an *lhcb1* mutant (bottom; generated using artificial microRNA) in state 1 (left) or state 2 (right).

IN BRIEF

A Rice KNOX Transcription Factor Represses Brassinosteroid Production in the Shoot Apical Meristem 3469
Kathleen L. Farquharson

Advice to the Lovelorn Polyploid Plant 3470
Jennifer Mach

Supply Route: ABCG Transporters Act in the Construction of Suberin Barriers 3471
